Unit trusts are medium to long-term investments. The value of units may go down as well as up and past performance is not necessarily a guide to the future. Unit trust prices are calculated on a net asset value basis, which is the total value of all assets in the portfolio including any income accrual and less any permissible deductions from the portfolio. Unit trusts are traded at ruling prices and can engage in borrowing and scrip lending. A schedule of fees and charges and maximum commission is available from the management company / scheme. Different classes of units apply to this fund and are subject to different fees and charges. Commission and incentives may be paid and if so, would be included in the overall costs. It should also be noted that as a result of the nature of wrap fund portfolios, an investor's underlying portfolio holdings and/or portfolio performance may differ slightly from the information reflected above. Therefore, performance figures presented on the fact sheet are approximate figures and may differ from actual performances of client accounts.

## FUND SENSITIVITY TO EQUITY MARKET

This scatter plot indicates the sensitivity of the fund returns to those of the equity market. This analysis shows that the fund exhibits little sensitivity to the direction of the equity market.

## COMMENTARY

A temperate July followed a ferocious June as bargain hunters returned to the market and risk aversion lessened. Political upheaval in Portugal and Egypt introduced some turbulence, but a number of positive economic surprises from the US, Japan and the euro zone stabilised the mood. By mid-month, political issues faded as the US earnings reporting season kicked-off with more than 70% of reporting companies exceeding profit forecasts.

China continued to slow down with second quarter GDP growth coming in at 7.5%. This finally forced the government to drip feed the economy with some easy reforms. But at the same time the government clamped down on excess production capacity in its continuing effort to shift the economy towards a more sustainable demand-driven growth path. China committed to ensuring that economic growth does not fall below 7% in 2013.

Gold had a volatile month, pushed down by prospects of an end to quantitative easing in the US, boosted again after the US Fed indicated that the timeline has not as yet been set, and pulled down by better than expected US economic data at month end.

The ECB and the Bank of England pledged to keep interest rates low, counterbalancing the news that the IMF has cut its global growth forecasts for 2013 and 2014 to 3.1% and 3.8%, respectively.

Markets have become more difficult to read in recent months. Until recently, any economic weakness has been viewed as positive for the continuation of quantitative easing, and hence positive for equities. Now that the end of quantitative easing is looming, investors are looking for a stronger US economy, hence the irrational volatility.

The Orbis Global Equity Fund, with its exposure limited to equities, has delivered an above benchmark return over the past year.

The Investec Global Strategic Managed Fund follows a globally diversified, actively managed strategy with exposure to cash, fixed income securities, convertible securities and equities.
