Unit trusts are medium to long-term investments. The value of units may go down as well as up and past performance is not necessarily a guide to the future. Unit trust prices are calculated on a net asset value basis, which is the total value of all assets in the portfolio including any income accrual and less any permissible deductions from the portfolio. Unit trusts are traded at ruling prices and can engage in borrowing and scrip lending. A schedule of fees and charges and maximum commission is available from the management company / scheme. Different classes of units apply to this fund and are subject to different fees and charges. Commission and incentives may be paid and if so, would be included in the overall costs. It should also be noted that as a result of the nature of wrap fund portfolios, an investor's underlying portfolio holdings and/or portfolio performance may differ slightly from the information reflected above. Therefore, performance figures presented on the fact sheet are approximate figures and may differ from actual performances of client accounts.

## FUND SENSITIVITY TO EQUITY MARKET

This scatter plot indicates the sensitivity of the fund returns to those of the equity market. This analysis shows that the fund exhibits little sensitivity to the direction of the equity market.

### COMMENTARY

The global economy began 2015 on a fragile note, with weakening manufacturing activity in China and the eurozone, a collapsing ruble threatening Russia's financial stability, political change in Greece resurrecting the spectre of the country exiting the euro, and commodities in free-fall on the back of a sinking oil price and a strong US dollar.

The World Bank cut its forecast for global growth in 2015 to 3.0%, as an improving US economy and low fuel prices fail to offset disappointing results from China, Japan and Europe. The news triggered a bout of safe-haven buying, with the US Treasury bonds trading at record low yields and the gold price surging. The run to safety continued after the Swiss National Bank removed its currency trading cap, leading to a sharp appreciation of the Swiss franc.

Within days the ECB launched its QE programme, announcing €1.1 trillion in new purchases of government bonds in monthly installments of €60 billion per month until September 2016 with the aim of reaching the targeted 2% rate of inflation. Markets soared in response, with bond yields falling and the euro weakening against the US dollar.

The trend reversed only temporarily after the leftist Greek Syriza party, a fierce opponent of Greece's bail-out deal with the EU and the IMF, swept to power. However, strong US corporate earnings reports ensured that the markets ended the month on a high.
